

EXCEL BASICS ASSIGNMENT

1. Explain the difference between Relative, Absolute, and Mixed Cell Referencing.

➤ There are three types of cell referencing given as below-

Relative Cell Referencing

Relative means that the reference of an area will be adjustable automatically when we copy the formula.

Example- we have entered the formula ($=A5*B4$) in cell C3. Now, copy this formula in cell D3, it will become $=B5*C4$

Absolute Cell Referencing

If we don't want to change the certain part of the cell address when we copy the formula, we need to put \$ sign before column letter and row number.

Example- $A5*\$B4$ this formula will not change when copied into another cell.

Mixed Cell Referencing

It is a combination of both Absolute and Relative cell referencing. Only relative part will change when it is copied.

Example- if the formula $\$A5*B\4 is copied to next cell it will change into $\$A6*B\4 .
